early E3 6.4K protein - human adenovirus 35
C; Species: Mastadenovirus h35 (human adenovirus 35)
A; Note: host Homo sapiens (man)
C; Date: 31-Mar-1990 #sequence_revision 31-Mar-1990 #text_change 09-Jul-2004
C; Accession: B31162
R; Flomenberg, P.R.; Chen, M.; Horwitz, M.S.
J. Virol. 62, 4431-4437, 1988
A; Title: Sequence and genetic organization of adenovirus type 35 early region 3.
A; Reference number: A93039; MUD:89012230; PMID:3172347
A; Reference number: B31162
A; Molecule type: DNA
A; Residues: 1-61 < FLO>

B7246
hypothetical protein APE1654 - Aeropyrum pernix (strain K1)
C;Species: Aeropyrum pernix
C;Decies: Aeropyrum pernix
C;Decies: 20-Aug-1999 #sequence_revision 20-Aug-1999 #text_change 09-Jul-2004
C;Accession: B72546
R;Kawarabayasi, Y.; Hino, Y.; Horikawa, H.; Yamazaki, S.; Haikawa, Y.; Jin-no, K.; Takahi awa, H.; Takamiya, M.; Masuda, S.; Funahashi, T.; Tanaka, T.; Kudoh, Y.; Vamazaki, J.; K.
DNA Res. G, 83-101, 1999
A,Title: Complete genome sequence of an aerobic hyper-thermophilic Crenarchaeon, Aeropyr.
A;Reference number: A72450; MUID:99310339; PMID:10382966
A;Accession: B72546
A;Accession: B72646
A;Accession: B72646
A;Accession: B72646
A;Accession: B7266
A;Accessi
                        A; Molecule type: protein
A; Residues: 'X',22-30,'X',32-44 <SEU>
A; Residues: 'X',22-30,'X',32-44 <SEU>
A; Note: this protein was found as a minor contaminant during the purification of prote C; Genetics:
A; Introns: 23/1; 116/1
C; Complex: heterodimer with MHC class I histocompatibility antigen alpha chain
C; Function:
A; Description: necessary for the expression of MHC class I histocompatibility antigen C; Superfamily: immunoglobulin C region; immunoglobulin homology
C; Keywords: heterodimer
F; 1-20/Domain: signal sequence #status predicted <SIG>
F; 21-119/Product: beta-2-microglobulin #status experimental <MAT>
F; 21-110/Domain: immunoglobulin homology <IMM>
F; 45-100/Disulfide bonds: #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       04-Feb-2000 #text_change 09-Jul-2004

A97760
NADH2 dehydrogenase (ubiquinone) (EC 1.6.5.3) - Rickettsia conorii (strain Malish 7)
C;Species: Rickettsia conorii
C;Accession: A97760
R;Ogata, H.; Audic, S.; Renesto-Audiffren, P.; Fournier, P.E.; Barbe, V.; Samson, D.; RC
Science 293, 2093-2098, 2001
A;Title: Mechanisms of Evolution in Rickettsia conorii and Rickettsia prowazekii.
A;Reference number: A97760
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-167 <KUR>
A;Residues: 1-167 <KUR>
A;Residues: 1-167 <KUR>
A;Gene: nuoE
C;Gene: nuoE
C;Superfamily: NADH dehydrogenase (ubiquinone) I chain E; NADH dehydrogenase (ubiquinone
C;Keywords: oxidoreductase; NAD
                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

hypothetical protein PAB1037 - Pyrococcus abyssi (strain Orsay)
N;Alternate names: yafJ homolog
C;Species: Pyrococcus abyssi
C;Date: 20-Aug-1999 #sequence_revision 20-Aug-1999 #text_change 09-Jul-2004
C;Accession: D75004
R;anonymous, Genoscope
submitted to the EMBL Data Library, July 1999
A;Description: Pyrococcus abyssi genome sequence: insights into archaeal chromosome struc
A;Reference number: A75001
A;Accession: D75004
A;Status: preliminary
A;Molecule type: DNA
A;Residuss: 1-208 <KAW>
A;Cross-references: UNIPROT:Q9UYDB; GB:AJ248288; GB:AL096836; NID:g5458960; PIDN:CAB50474;
A;Experimental source: strain Orsay

C.!- CATALYTIC ACTIVITY: L-2,4-diaminobutyrate + 2-oxoglutarate = L-

Glutamate + L-aspartic 4-semialdehyde.

C.!- CATALYTIC ACTIVITY: L-2,4-diaminobutyrate + 2-oxoglutarate = L-

Glutamate + L-aspartic 4-semialdehyde.

C.!- CATALYTIC ACTIVITY: Belongs to the class-III pyridoxal-phosphate-dependent

C.!- PATHWAY: Siderophore biosynthesis; rhizobactin biosynthesis.

C.!- SIMILARITY: Belongs to the class-III pyridoxal-phosphate-dependent

aminotransferase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                "Generation of the region encoding regulation, biosynthesis, and transport of rhizobactin 1021, a siderophore produced by Sinorhizobium meliloti.";

Elycoprotein.";

Slockemistry 35:1925-1934(1996).

Slockemistry and divalent metal ions. It can inhibit rosette formation and is known to interact with heparin, thrombospondin, and the lysine-binding site of plasminogen. On the basis of its homology with HMW kininogen, the His-rich region of this protein may mediate the contact activation phase of intrinsic blood coagulation cascade.

Slockemistry and secreted in plasma.

Slockemistry and secreted in plasma.

Recaptor mutations and allelic deletion of tumor suppressor gene of the system upon ligand binding. Its association with UNC5 proteins may trigger signaling for axon requision. It also acts as a dependence receptor required for apoptosis induction when not associated with netrin ligand. Implicated as a tumor suppressor gene.

C. SUBUMAT: Interact with the cytoplasmic part of UNC5A, UNC5B, UNC5C and probably UNC5D (By similarity).

C. SUBUMAT: Interact with the cytoplasmic part of UNC5A, UNC5C.

INCSC and probably UNC5D (By similarity).

C. SUBCELLULAR LOCATION: Type I membrane protein.

C. SUBCELLULAR LOCATION of DCC due to allelic deletion and/or differentiate into mucus producing cells uniformly lack DCC expression. Inactivation of DCC due to allelic deletion and/or metastasis of esophageal squamous cell carcinomas.

C. SIMILARITY: Contains 6 fibronectin type III domains.

C. SIMILARITY: Contains 6 fibronectin type III domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. (ATTE-) ATTENUON LLC.

Mazar AP; Plunkett ML, Harris S, Donate F,

WPI; 2002-666989/71.

New histidine-proline rich glycoprotein (HPRG) polypeptide, useful for diagnosing or treating diseases associated with undesired cell migration, invasion, proliferation, or angiogenesis, e.g. cancer, atherosclerosis.

Claim 2; Page 67; 82pp; English

The present sequence is a specific example of claimed anti-angiogenic pentapeptides of the invention. Claimed anti-angiogenic polypeptides or peptides comprise: the histidine-proline-rich (H/P) domain of human histidine proline rich glycoprotein (HPRG, see ABB79806); an H/P domain of rabbit HPRG (see ABB79807); a variant of these that is capable of inhibiting angiogenesis, endothelial cell proliferation or endothelial tube formation in vitro or in vivo; or a pentapeptide having the generic sequence given in ABB79808, such as the present peptide, or its variant having an additional 1 to 4 amino acids comprising His, Pro or Gly at its No or C-terminus. Also claimed are: chemically synthesised or recombinantly produced peptide multimers; a diagnostically or

```
multimer; a diagnostically useful HPRG-related composition, comprising the diagnostically labeled polypeptide, peptide or peptide multimer and a carrier; an antibody specific for an epitope of HPRG that is present in the diagnostically labeled polypeptide, peptide or peptide multimer and a carrier; an antibody specific for an epitope of HPRG that is present in the HPR domain of human or rabbit HPRG, and which binds to HPRG or to any of the domains in a way which inhibits the anti-angiogenic activity of HPRG or the domain, or an antigan-binding fragment of the antibody; a method for inhibiting call migration, cell invasion, cell proliferation or angiogenesis, a method for treating a medical migration, invasion, proliferation, or angiogenesis; a method of stimulating or inhibiting angiogenesis in a subject; a method of estimulating or inhibiting angiogenesis in a subject; a method of stimulating or inhibiting angiogenesis in a subject; a method of estimulating or inhibiting angiogenesis in a subject; a method of stimulating or inhibiting angiogenesis in a subject; transfected cells; a method of providing to a cell, tissue or organ andial peptide multimer; an affinity ligand useful for transfected cells; a method of providing to a cell, tissue or organ and peptide multimer; an affinity ligand useful for the binding molecule, comprising the polypeptide, peptide or peptide multimer; and anthod of conjudical support or carrier; and a method of soluting molecule, or isolating or enriching cells captions and methods are useful in diagnosing or treating a disease or condition associated with undesired cell migration, invasion, proliferation, or angiogenesis, such as cancer, atherosclerosis, diabetic cells and methodes are useful in inhibiting the growth of primary cumours or metastases, and may also be used in treating neurodegenerative ethical processes into and may also be used in treating neurodegenerative ethical processes and may also be used in treating are ethical processes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The invention relates to an isolated tropomyosin (Tpm)-related
antiangioganic receptor polypeptide or peptide, which is a is a fragment
of a full-length native Tpm protein expressed on the surface of
a full-length native Tpm protein expressed on the surface of
of a full-length native Tpm protein expressed on the surface of
c andothelial cells, or a variant of the fragment. It has a molecular mass
of about 17 kDa and corresponds in its sequence to, or is a variant of,
an internal fragment of a native Tpm its sequence to, or is a variant of,
of applyeptide peptide or variant has substantially the same biochemical
activity of binding to the antiangiogenic polypeptide agent that
protein to the isolated polypeptide or peptide is human histidine-proline
c native Tpm internal fragment. The antiangiogenic polypeptide agent that
binds to the isolated polypeptide or peptide is human histidine-proline
c rich glycoprotein (HRRG), rabbit HPRG, a Tpm-binding, antiangiogenic homologue, variant, domain of fragment of the HRR or its D5
c human kininogen (HK), the D5 domain of HK, or a Tpm-binding,
c companion. The Tpm-related antiangiogenic receptor polypeptide or peptide
antiangiogenic homologue, variant, domain or fragment of the HR or its D5
c antiangiogenic homologue, variant, domain or fragment of the HR or its D5
c antiangiogenic homologue, variant, domain or fragment of the HR or its D5
c antiangiogenic pomologue, variant, domain or fragment of the HR or its D5
c antiangiogenic pomologue, variant, domain or angiogenesis, for inducing
migration, invasion, proliferation or angiogenesis, for inducing
c endothelial cell apoptosis, or for treating tumours or cancer, diabetic
c retinopathy, neovascular glaucoma, uveitis, endometriosis, arthritis,
c psoriasis, or scleroderma. The antibody may be also used for detecting
the presence of a Tpm polypeptide or peptide in a biological sample,
c promoting wound healing, or for treating diseases or conditions in which
increased angiogenesis is desired engangenesis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The polymucleotide sequences given in AAC74223-C74279 encode the human secreted proteins represented in AAB39179-B39226. Sequences AAB39227-C78939308 are alternative proteins encoded by the genes, and also protein sequences with which they share homology. The proteins have activities bequences with which they share homology. The proteins have activities cardinate immunosuppressive, antiarthritic; antirheumatic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; cortropic; neuroprotective; antibacterial; virucide; fungicide; and coptialmalogical. The human secreted proteins, polymucleotides; and optialmalogical. The human secreted proteins, polymucleotides; and agonists of the invention may be useful in the treatment, prevention, and/or diagnosis of various disease, disorders and conditions such as autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative cisorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound chealing and epithelial cell proliferation, to regenerate tissues, maintain organs before transplantation, in chemotaxis and as a food additive or preservative e.g. to increase storage capabilities. Sequences characterisation of the genes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                        Isolated nucleic acid molecule encoding a human secreted protein is used in preventing, treating or ameliorating a medical condition.

                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide #1663 encoded by probe for measuring cervical gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                   ö
                                         The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human placenta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to single exon nucleic acid probes (SENP: see AAI3131315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                         expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from manA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                                                                                    New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes.

The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                       Protein #1654 encoded by probe for measuring heart cell gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Single exon nucleic acid probes for analyzing gene expression in human hearts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                           The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                ed single exon nucleic acid probes useful for analyzing human bone marrow.

                                                                                                                                                                                                                                                             The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               for

specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver.

(I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG59930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               nucleic acid probe used to measuring gene expression in
                                                                                                                                                                                                                                                                                                                                                                                                                          st disease; breast cancer; development disorder; se; proliferative breast disease; non-carcinoma tumour.
                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                      expression
                                                                                                                                                                                                                     .;

```

The present invention relates to novel single exon nucleic acid probes (see AAI00010-AAI10067). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative

array, identifying exons in a eukaryotic genome, comprising (a)
algorithmically predicting at least one exon from genomic sequences of
algorithmically predicting at least one exon from genomic sequences of
the eukaryote; and (b) detecting specific hybridisation of detectably
labeled nucleic acids from eukaryote lung mRNA, to a single exon probe,
having a fragment identical to the predicted exon, the probe is included
in the above mentioned microarray; assigning exons to a single gene,
comprising (a) identifying exons from genomic sequence by the method
above mentioned microarray; assigning exons in several
comprising (a) identifying exons from genomic sequence by the method
above mentioned microarray; assigning exons in several
comprising (a) identifying exons in the exons in several
comprising (a) identifying exons in the tissues and/or cell types indicates that
compression of the exons in the tissues and/or cell types indicates that
compression of the exons in the tissues are used for gene expression
compression of the exons in the specification, or encoded by the
comprise, and for identifying exons in a gene, particularly using human
compression reading frames (ORP). The probes are used for gene expression
concer, chronic obstructive pulmonary fibrosis, neurofibromatosis,
concer, chronic obstructive pulmonary dysplasia, primary ciliary
concern sequence is a peptide/protein encoded by a single exon probe of
the invention. Note: The sequence data for this patent did not form part
concern for present sequence and protein encoded by a single exon probe of
concern free prime appetide/protein encoded protein encoded protein e
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
